Answer all questions: (Time - 45 mins) (Full Marks- 30) Let Q be an orthogonal matrix, then show that (i) Q^{-1} is orthogonal. (ii) $det(Q) = \pm 1$. (iii) If λ is an eigenvalue of Q, then $|\lambda| = 1$. ? Prove that an orthogonal 2 × 2 matrix must have the form, $\begin{pmatrix} a & -b \\ b & a \end{pmatrix}$ or $\begin{pmatrix} a & b \\ b & -a \end{pmatrix}$ where $\begin{pmatrix} a \\ b \end{pmatrix}$ is a unit vector. 3. Let A be a nilpotent matrix (that is b $A^m = O$ for some m). Show that $\lambda = 0$ is the only eigen value of A. 1. Let A be an idempotent matrix (that is $A^2 = A$). Show that $\lambda = 0$ and $\lambda = 1$ are the only eigen value of A. 5. Let v is an eigen vector of A, with corresponding eigen value λ and c is scalar. Show that v is an eigen vector of A-cI with corresponding eigen value $\lambda - c$. 6. Compute the (a) characteristic polynomial, (b) the eigen values, (c) basis for each eigen space, (d) algebric and geometric multiplicity of each eigen values, for the following matrix, (4)A. Apply Gram Schmidt process to find an orthogonal basis for the column spaces of the matrix

Suppose that u, v and w are vectors in inner product space such that, $\langle u, v \rangle = 1$, $\langle u, w \rangle = 5$, $\langle v, w \rangle = 0$, ||u|| = 1, $||v|| = \sqrt{3}$, ||w|| = 2, then evaluate the expressions,

$$(i) < u + w, v - w > i$$

(ii)
$$< 2v - w, 3u + 2w >$$

(iii)
$$||u+v||$$
 (6)
